Sandwell and West Birmingham Hospitals; 6. Aintree University NHS Trust, Liverpool, UK; 7. Aberdawe Bro Morgannwg University

Introduction

• Treatment with dapagliflozin, a sodium glucose transporter 2 (SGLT2) inhibitor, increases glucosuria and improves glycaemic control in patients with type 2 diabetes.
• This action is independent of beta cell function. Conceptually, dapagliflozin should be equally efficacious among patients with early or advanced type 2 diabetes.
• We investigated whether the glycaemic response to dapagliflozin differed according to the intensity of background diabetes treatment or duration of diabetes diagnosis. We analysed data from a nationwide audit in UK.

Methods

• The Association of British Clinical Diabetologists (ABCD) conducted a nationwide audit of the use of dapagliflozin based in real-life clinical practice. Diabetes centres across the UK were invited to participate.
• Participating physicians provided anonymized information on demographic data (age, gender, ethnicity, height, weight), duration of diabetes, cardiovascular parameters (glycaemia, blood pressure, lipids, alamine aminotransferase and creatinine) and treatments prescribed, before and after treatment with dapagliflozin. Information on adverse events were also collected.
• Between October 2014 and December 2015, 57 centres submitted data on 1720 patients started on dapagliflozin in routine practice.

Analysis of Outcomes

• Patients were stratified for receipt of none, one, two or three background diabetes drugs (oral therapies or GLP-1 receptor agonists), or insulin (± oral therapies/GLP-1 receptor agonists).
• In a separate analysis, patients were stratified according to diabetes duration of 0-5, 6-10 and >10 years.
• Changes in HbA1c were compared across groups (ANOVA) using baseline HbA1c and eGFR as covariates.
• The latest HbA1c at 26 weeks, with a minimum of 13 weeks after treatment were used.

Subjects:

Inclusions-

• 718 patients were analyzed according to intensity of diabetes treatments

Exclusions-

• 612 patients were analyzed according to duration of diabetes

Results

Table 1: Baseline characteristics of 718 patients on dapagliflozin

Data input Oct 2014 – Dec 2015

We thank all the nationwide contributors for submitting data of patients on dapagliflozin. The ABCD nationwide dapagliflozin audit is supported by an unrestricted grant from Astra Zeneca. The audit was independently initiated and performed by ABCD and the authors remained independent with the analysis and writing of this report.

Conclusion

• No differences in glycaemic reduction were observed between patients on various number of diabetes drugs except comparing patients on two diabetes drugs with patients on insulin.
• No differences in glycaemic reduction were observed between patients with short or long diabetes duration

Acknowledgement

• Patients on different number of background diabetes treatments, or with different duration of disease, all achieve significant glycaemic improvement with dapagliflozin treatment.
• Dapagliflozin should be considered comparably as effective in patients with more advanced type 2 diabetes.
